Batteries plus phone battery coupon

By Robin Noelle Wireless phones use many different types of rechargeable batteries, depending on the manufacturer and phone model. Phones are shipped with battery charge almost depleted, so it is important to fully charge the battery, usually overnight, before using the phone. It can take several charge cycles to maximize battery charge. Once charged, the battery should last from one to three years depending on its use and treatment of the battery. Wireless phones are shipped with the battery almost depleted. You may still be able to turn on your phone with the remaining small charge. However, it is important to fully charge the battery before use. Plug the AC adapter for the charger into the wall and then insert the phone into the charger, making sure it is fully seated at the base. Depending on your model, a charge or light symbol may appear on the handset or at the base of your phone. Allow the phone to charge overnight before use. How long you can use your phone in a fully charged battery varies. It depends on the age of the battery, the model and the characteristics of the phone and the energy demands of the equipment. You can find out how long your phone's battery should last from the information included with your phone or through a buyer's guide like CNET or Consumer Reports. Fully charged batteries are usually good for eight to 12 hours, but could be longer or much shorter. A rechargeable battery will gradually lose its ability to hold a charge over time. Generally, a battery can contain a full charge for between 500 and 800 charge/recharge cycles. A charge cycle is total exhaustion and then battery recharge. But most people don't drain the battery every time before they charge it. Batteries should last an average of between one and three years. If you are not using your wireless phone for an extended period of time, you must properly store the battery to maximize its lifespan. If possible, lower the battery to about 30% of the charge and remove it from the phone. Store the battery in a cool, dark place, like your refrigerator door, not in the freezer! When it's time to replace rechargeable batteries, don't throw them away. Batteries contain metals such as mercury, lead, cadmium and nickel can contaminate the environment if not disposed of properly. Some states, such as California, require you to recycle their old batteries. You can find where to recycle used batteries in Resources below. My friend gave me an old cell phone, no battery. (No, it has no service.) I don't know if it works. It's a Motorola 1860. Where the battery goes is four pins. How can I connect an AA, or AAA, etc. battery to it to see if it works. The first time I tried it, it got really hot and then the battery smelled like it was on fire. The second time he triggered. Is it possible to do this? If so, I need to know the voltage, polarity and which pins to use.
